yzong@cmu.edu

June 10, 2013

Important: Before installing Python 2.7, you must uninstall any other versions of Python. Failure to do so may result in incompatibility issues. See <http://www.wikihow.com/Uninstall-Python> for instructions on how to uninstall Python.

Target Audience:

Anyone who knows what Python 2.7 is and wants their computer to be able to run Python 2.7 scripts. We assume some familiarity with web browsing, including downloading and opening files.

Objective: This document explains how to download, install, and configure Python for your Windows 7 computer, allowing all users of your computer to run Python scripts and programs from the Windows Command Line.

You will need:

A 64-bit computer with Windows 7 and an internet connection. You must also have administrative privileges on this computer.

Duration:

Completing these **5 steps** should take about **10 minutes**.

Outcome:

After completing these steps, all users on your computer should be able to run the Python 2.7 Interpreter, as well as Python 2.7 scripts (**.py** files) and compiled Python 2.7 programs (**.pyc** files).

This document does not explain how to use Python 2.7; for instructions on how to use Python 2.7, see <http://www.python.org/>.

Step 1 (on page 1) will show you how to download the Python installer.

Step 1: Downloading the Python Installer

In this step, you will download the Python Installer, a program which will install Python on your computer. This step has 2 substeps.

- a. Open the URL <http://www.python.org/download/releases/2.7.5/> in your web browser.
- b. Locate and single-click “Windows X86-64 MSI Installer” (highlighted in Figure 1) to download the installer.

Download

This is a production release. Please [report any bugs](#) you encounter.

We currently support these formats for download:

- [XZ compressed source tar ball \(2.7.5\) \(sig\)](#)
- [Gzipped source tar ball \(2.7.5\) \(sig\)](#)
- [Bzipped source tar ball \(2.7.5\) \(sig\)](#)
- [Windows x86 MSI Installer \(2.7.5\) \(sig\)](#)
- [Windows x86 MSI program database \(2.7.5\) \(sig\)](#)
- **[Windows X86-64 MSI Installer \(2.7.5\) \[1\] \(sig\)](#)** ← **Step 1b**
- [Windows X86-64 program database \(2.7.5\) \[1\] \(sig\)](#)
- [Mac OS X 64-bit/32-bit x86-64/i386 Installer \(2.7.5\) for Mac OS X 10.6 and later \[2\] \(sig\)](#).
- [Mac OS X 32-bit i386/PPC Installer \(2.7.5\) for Mac OS X 10.3 and later \[2\] \(sig\)](#).

Figure 1: Link to Python Installer (step 1b.)

Step 2 (on page 2) will show you how to use this file to Install Python.

Step 2: Installing Python

This step has 6 substeps.

- a. Locate the file `python-2.7.5.msi` on your computer. The file location will depend on your web-browser's download settings.
- b. Double-click `python-2.7.5.msi` to run it.
- c. If a 'Security Warning' window appears, click "Run" (labeled in Figure 2).

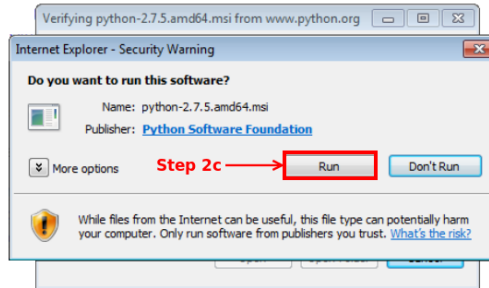

Figure 2: "Security Warning" window (steps 2b. and 3e.)

- d. In the next window, click "Next" without changing any settings.
- e. Typically, the default installation directory will suffice. To change the installation directory, select from the drop down menu or type the directory path in the text box labeled in Figure 3. Click "Next" when done.

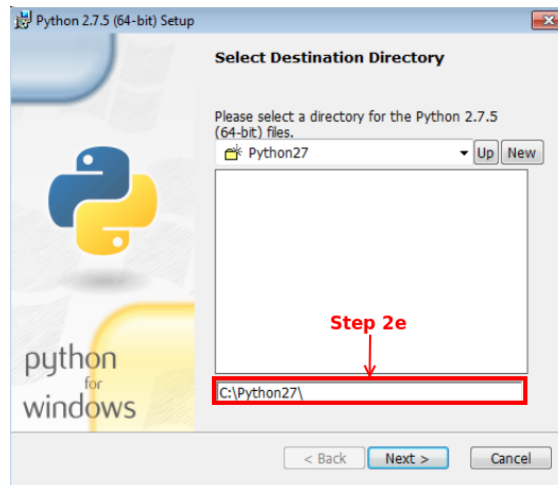

Figure 3: Choosing an Installation Directory window (step 2e.)

- f. Click "Next" without changing any settings. Wait for the installation to complete. Then, click "Finish" to close the installation program.

Step 3 (on page 3) will begin explaining how to configure your computer to run Python.

Step 3: Opening the Environment Variables Menu

Now, you will modify the Path Environment Variable. This is necessary for your command line to run Python files. This step has 6 substeps.

- a. Open the Start Menu by clicking the bottom left corner of your screen (labeled in Figure 4).
- b. Click on “Control Panel” (labeled in Figure 4) to open the Control Panel.

Figure 4: The Start Menu (steps 3a. and 3b.)

- c. Type “advanced” (without quotes) into the Search Box in the top right corner of the Control Panel window (as in Figure 5).
- d. Click “View advanced system settings” (labeled in Figure 5).

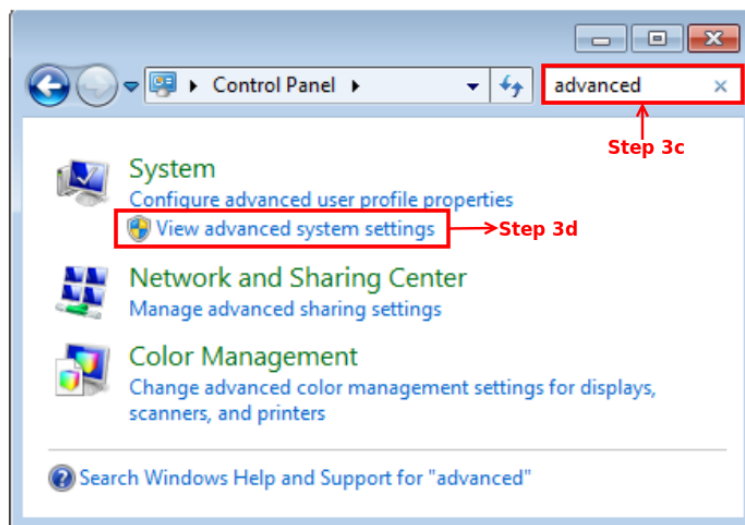

Figure 5: The Control Panel (steps 3c. and 3d.)

- e. If a “User Account Control” window appears, click “Yes” (labeled in Figure 6).

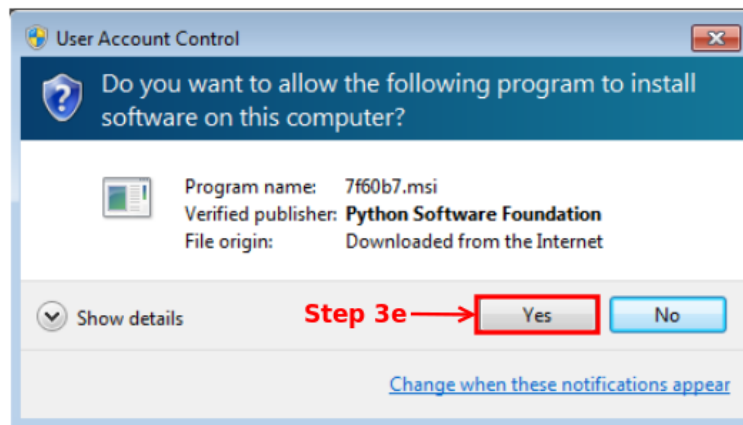

Figure 6: The User Account Control window (step 3e.)

- f. In the “System Properties” window, click “Environment Variables” (labeled in Figure 7).

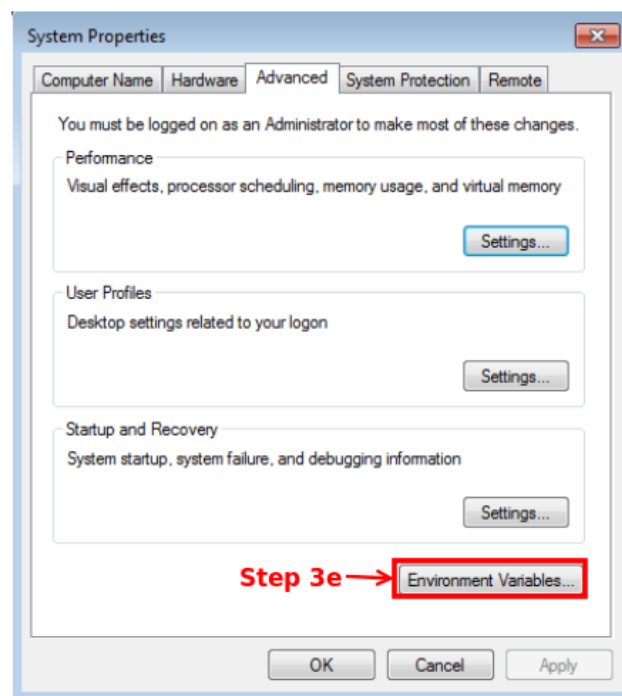

Figure 7: System Properties window and the Environment Variables button (step 3f.)

Step 4 (on page 5) will show you how to modify the Path Environment Variable.

Step 4: Modifying the Path Environment Variable

In this step, you will modify the Path environment variable, telling your command line the location of your Python Installation. This step has 3 substeps.

Caution: Important system services depend on Environment Variables. Do not modify any Environment Variables except Path, and do not remove anything from the Path variable; only **add** information to the Path variable. If you make a mistake, click “Cancel” to undo any changes.

- a. In the “Environment Variables” window that appears, under the “System Variables” section scroll down to locate the Path variable, as shown in Figure 8. Double-click the word “Path.”

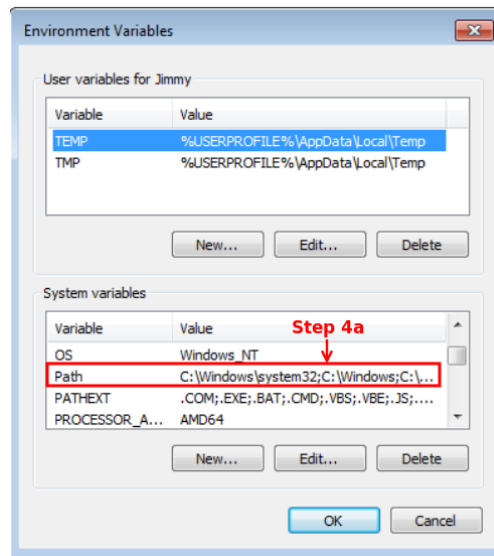

Figure 8: Environment Variables window and the Path variable (step 4a.)

- b. An “Edit System Variable” window will appear. In the “Variable value” box (do not delete anything!), add “;C:” followed by the name of the directory you selected in step 2e. (for the default directory, add “;C:\Python27” (without quotes), as shown in Figure 9).

Figure 9: The Edit System Variable window (step 4b.)

- c. Click “OK” to close each of the “Edit System Variable” and “Environment Variables” windows.

You now have Python 2.7 installed and configured on your computer. **Step 5** (on page 6) will show you how to access the Python interpreter to start using Python right away.

Step 5: Opening the Python Interpreter

In this step, you will verify that the previous steps worked by opening the Command Line Python Interpreter. This step has 4 substeps.

- Open the Start Menu by clicking the bottom left corner of your screen (labeled in Figure 10).
- In the search box, type “cmd” (without quotes), as shown in Figure 10).
- Click on “cmd” (labeled in Figure 10).

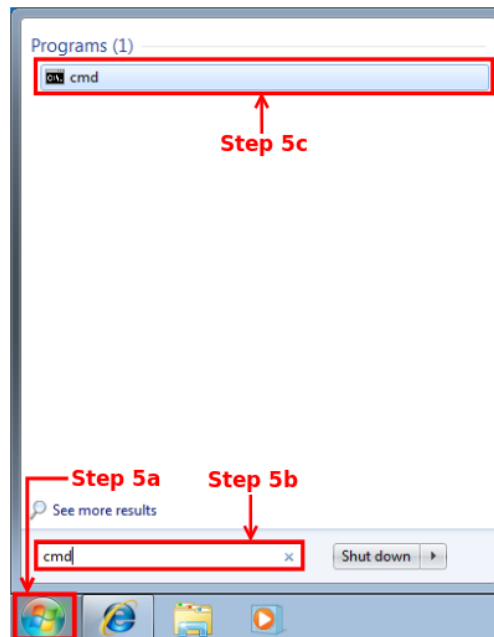

Figure 10: Accessing the command line from the Start Menu (steps 5a-5c.)

- A Command Line window should appear. Type “Python” and press Enter. Python should begin running, as shown in Figure 11.

Figure 11: The Windows Command Line running the Python Interpreter (step 5d.)

You may now begin entering Python commands.
